## EXERCISE 2.9

Q.1: Determine the intervals in which $f$ is increasing or decreasing for the domain mentioned in each case.
(i) $\quad \mathbf{f}(\mathbf{x})=\sin \mathbf{x} \quad ; \quad \mathbf{x} \in(-\pi, \pi)$
(ii) $\quad \mathbf{f}(\mathbf{x})=\cos \mathbf{x} \quad ; \quad \mathbf{x} \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$ (L.B 2005)
(iii) $f(x)=4-x^{2} \quad ; \quad x \in(-2,2)$
(iv) $\quad f(x)=x^{2}+3 x+2 \quad ; \quad x \in(-4,1)$

## Solution:

$$
\begin{aligned}
& \mathrm{f}(\mathrm{x})=\sin \mathrm{x} \\
& \mathrm{f}^{\prime}(\mathrm{x})=\cos \mathrm{x}
\end{aligned}
$$

Put
$\mathrm{f}^{\prime}(\mathrm{x})=0$
$\Rightarrow \quad \cos x=0$
$\Rightarrow \quad x=\frac{-\pi}{2}, \frac{\pi}{2}$
So the sub-intervals are
$\left(-\pi, \frac{-\pi}{2}\right),\left(\frac{-\pi}{2}, \frac{\pi}{2}\right),\left(\frac{\pi}{2}, \pi\right)-1,00 \%$
For $\left(-\pi, \frac{-\pi}{2}\right)$
$\mathrm{f}^{\prime}(\mathrm{x})=\cos \mathrm{x}<0 \quad$ in $\left(-\pi, \frac{-\pi}{2}\right)$
So $f(x)$ is decreasing in $\left(-\pi, \frac{-\pi}{2}\right)$
$\operatorname{For}\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$
$\mathrm{f}^{\prime}(\mathrm{x})=\cos \mathrm{x}>0 \quad$ in $\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$
So $f(x)$ is increasing in $\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$
For $\left(\frac{\pi}{2}, \pi\right)$

$$
\mathrm{f}^{\prime}(\mathrm{x})=\cos \mathrm{x}<0 \quad \text { in }\left(\frac{\pi}{2}, \pi\right)
$$

So $\quad f(x)$ is decreasing in $\left(\frac{\pi}{2}, \pi\right)$
(ii) $f(x)=\cos x \quad ; \quad x \in\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$

$$
f^{\prime}(x)=-\sin x
$$

Put

$$
\begin{aligned}
\mathrm{f}^{\prime}(\mathrm{x}) & =0 \\
\sin \mathrm{x} & =0 \\
\mathrm{x} & =0
\end{aligned}
$$

So the sub-intervals are $\left(\frac{-\pi}{2}, 0\right),\left(0, \frac{\pi}{2}\right)$
$\operatorname{For}\left(\frac{-\pi}{2}, 0\right)$
$\mathrm{f}^{\prime}(\mathrm{x})=-\sin \mathrm{x}>0$
is increasing in $\left(\frac{-\pi}{2}, 0\right)$ in $\left(\frac{-\pi}{2}, 0\right)$
$\left(0, \frac{\pi}{2}\right)$

$$
\mathrm{f}^{\prime}(\mathrm{x})=-\sin \mathrm{x}<0 \amalg \mathrm{in}\left(\overline{0}, \frac{\pi}{2}\right) \ggg 00
$$

So f is decreasing in $\left(0, \frac{\pi}{2}\right)$
(iii) $\mathrm{f}(\mathrm{x}) \quad=4-\mathrm{x}^{2} \quad ; \quad \mathrm{x} \in(-2,2) \quad$ (L.B 2008)
$f^{\prime}(x)=-2 x$
Put

$$
\begin{array}{ll}
\mathrm{f}^{\prime}(\mathrm{x}) & =0 \\
-2 \mathrm{x} & =0 \\
\mathrm{x} & =0
\end{array}
$$

So the sub-intervals are $(-2,0)$ and $(0,2)$
For $(-2,0)$

$$
f^{\prime}(x)=-2 x>0 \quad \text { in } \quad(-2,0)
$$

So $f(x)$ is increasing in $(-2,0)$
For ( 0,2 )

$$
\mathrm{f}^{\prime}(\mathrm{x})=-2 \mathrm{x}<0 \quad \text { in } \quad(0,2)
$$

So $\quad f(x)$ is decreasing in $(0,2)$
(iv) $\mathrm{f}(\mathrm{x})=\mathrm{x}^{2}+3 \mathrm{x}+2 ; \mathrm{x} \in(-4,1)($ L. $\boldsymbol{B}$ 2007) (G.B 2008)

$$
\mathrm{f}^{\prime}(\mathrm{x})=2 \mathrm{x}+3
$$

Put

$$
\begin{aligned}
& \mathrm{f}^{\prime}(\mathrm{x})=0 \\
& 2 \mathrm{x}+3=0 \\
& 2 \mathrm{x}=-3 \\
& \mathrm{x}=\frac{-3}{2}
\end{aligned}
$$

So the sub-intervals are $\left(-4, \frac{-3}{2}\right),\left(\frac{-3}{2}, 1\right)$
For $\left(-4 \quad, \frac{-3}{2}\right)$

$$
f^{\prime}(x)=2 x+3<0 \text { in }\left(-4, \frac{-3}{2}\right)
$$

So $\quad f(x)$ is decreasing in $\left(-4, \frac{-3}{2}\right)$ Po
For $\left(\frac{-3}{2}, 1\right)$

$$
f^{\prime}(x)=2 x+3>0 \text { in }\left(\frac{-3}{2}\right.
$$

CR

So $\quad f(x)$ is increasing in $\left(\frac{-3}{2}, \frac{1}{1}\right)$
Q.2: Find the extreme values of the following functions defined as
(i) $f(x)=1-x^{3}$
(ii) $f(x)=x^{2}-x-2$
(iii) $f(x)=5 x^{2}-6 x+2$
(iv) $f(x)=3 x^{2}$
(v) $f(x)=3 x^{2}-4 x+5$
(vi) $f(x)=2 x^{3}-2 x^{2}-36 x+3$
(vii) $f(x)=x^{4}-4 x^{2}$
(viii) $f(x)=(x-2)^{2}(x-1)$
(ix) $f(x)=5+3 x-x^{3} \quad($ L.B 2011)

## Solution:

(i) $f(x)=1-x^{3}$
$f^{\prime}(x)=-3 x^{2}$
$f^{\prime \prime}(\mathrm{x})=-6 \mathrm{x}$
For stationary points

$$
\text { Put } \begin{aligned}
\mathrm{f}^{\prime}(\mathrm{x}) & =0 \\
-3 \mathrm{x}^{2} & =0
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{x}^{2}=0 \\
& \mathrm{x}=0
\end{aligned}
$$

The second derivative does not help in determining the extreme values.

| Before | $\mathrm{x}=0$ |  |  |
| :--- | :--- | :--- | :--- |
| After | $\mathrm{x}=0$ | , | $\mathrm{f}^{\prime}(\mathrm{x})$ |

$\therefore \quad \mathrm{x}=0$ has a point of inflection.
Put

$$
\begin{aligned}
\mathrm{x} & =0 \text { in } \\
\mathrm{f}(\mathrm{x}) & =1-\mathrm{x}^{3} \\
\mathrm{f}(0) & =1-(0)^{3}=1
\end{aligned}
$$

$\therefore \quad$ Point of inflection is $(0,1)$
(ii) $f(x)=x^{2}-x-2$
$f^{\prime}(x)=2 x-1$
$f^{\prime \prime}(x)=2$
For stationery points
Put $\begin{aligned} \mathrm{f}^{\prime}(\mathrm{x}) & =0 \\ 2 \mathrm{x}-1 & =0 \\ 2 \mathrm{x} & =1 \\ \mathrm{x} & =\frac{1}{2}\end{aligned}$

$$
\mathrm{f}^{\prime \prime}\left(\frac{1}{2}\right)=2>0
$$

$\therefore \quad \mathrm{f}$ has relative minima at $\mathrm{x}=\frac{1}{2}$
Put $\mathrm{x}=\frac{1}{2}$ in

$$
f(x)=x^{2}-x-2
$$

$$
\mathrm{f}\left(\frac{1}{2}\right)=\left(\frac{1}{2}\right)^{2}-\frac{1}{2}-2
$$

$$
=\frac{1}{4}-\frac{1}{2}-2
$$

$$
=\frac{1-2-8}{4}=\frac{-9}{4}
$$

\mathrm{x} \quad \frac{\pi}{4} \quad, \quad \mathrm{x} & =\pi+\frac{\pi}{4} \\
\mathrm{x} & =\frac{5 \pi}{4}
\end{aligned}
$$

Put $\quad \mathrm{x}=\frac{\pi}{4}$ in $\mathrm{f}^{\prime \prime}(\mathrm{x})$, we get

$$
\begin{aligned}
\mathrm{f}^{\prime \prime}\left(\frac{\pi}{4}\right) & =-\sin \frac{\pi}{4}-\cos \frac{\pi}{4} \\
& =\frac{-1}{\sqrt{2}}-\frac{1}{\sqrt{2}} \\
& =\frac{-1-1}{\sqrt{2}}
\end{aligned}
$$

$$
=\frac{-2}{\sqrt{2}}<0
$$

$\therefore \quad \mathrm{f}$ has relative maxima at $\mathrm{x}=\frac{\pi}{4}$
Put $\quad x=\frac{\pi}{4}$ in

$$
f(x) \quad=\sin x+\cos x
$$

$$
f\left(\frac{\pi}{4}\right)=\sin \frac{\pi}{4}+\cos \frac{\pi}{4}
$$

$$
=\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}}
$$

$$
=\frac{1+1}{\sqrt{2}}
$$

$$
=\frac{2}{\sqrt{2}}
$$

Hf llaidn

Put $\mathrm{x}=\frac{5 \pi}{4}$ in $\mathrm{f}^{\prime \prime}(\mathrm{x})$, we get $5=101100 \mathrm{M}$

$$
\begin{aligned}
\mathrm{f}^{\prime \prime}\left(\frac{5 \pi}{4}\right) & =-\sin \frac{5 \pi}{4}-\cos \frac{5 \pi}{4} \\
& =\left(\frac{-1}{\sqrt{2}}\right)-\left(\frac{-1}{\sqrt{2}}\right) \\
& =\frac{1}{\sqrt{2}}+\frac{1}{\sqrt{2}} \\
& =\frac{1+1}{\sqrt{2}} \\

Q.4: Show that $y=\frac{\ell n x}{x}$ has maximum value at $x=e$

## Solution:

$$
\begin{aligned}
y & =\frac{\ell n x}{x} \\
\frac{d y}{d x} & =\frac{x \cdot \frac{1}{x}-\ell n x \cdot 1}{x^{2}} \\
\frac{d y}{d x} & =\frac{1-\ell n x}{x^{2}} \\
\frac{d^{2} y}{d x x^{2}} & =\frac{x^{2} \cdot \frac{-1}{x}-(1-\ell n x) \cdot 2 x}{\left(x^{2}\right)^{2}} \\
\frac{d^{2} y}{d^{2}} & =\frac{-x-2 x+2 x \ell n x}{x^{4}} \\
\frac{d^{2} y}{d^{2}} & =\frac{-3 x+2 x \ell n x}{x^{4}}
\end{aligned}
$$

For stationary points

$$
\text { Put } \quad \begin{aligned}
& \frac{\mathrm{dy}}{\mathrm{dx}}=0 \\
& \frac{1-\ln \mathrm{x}}{\mathrm{x}^{2}}=0 \\
& 1-\ln \mathrm{x}=0 \\
& 1=\ell \mathrm{nx} \\
& \operatorname{lnx}=\ell \mathrm{ne}
\end{aligned}
$$

$$
\mathrm{x}=\mathrm{e} \quad \because \ell \text { ne }=1
$$

Put $\quad x=e \quad$ in $\frac{d^{2} y}{d^{2} x}$, we get

$$
\begin{aligned}
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{~d}^{2} \mathrm{x}} & =\frac{-3 \mathrm{e}+2 \mathrm{e}}{\mathrm{e}^{4}} \\
& =\frac{-\mathrm{e}}{\mathrm{e}^{4}} \\
& =\frac{-1}{\mathrm{e}^{3}}<0 \\
\text { nows } & y=\frac{\ln \mathrm{x}}{\mathrm{x}} \text { has maximum value at } \mathrm{x}=\mathrm{e} .
\end{aligned}
$$

Q.5: Show that $\mathrm{y}=\mathrm{x}^{\mathrm{x}}$ has a minimum value at $\mathrm{x}=\frac{1}{\mathrm{e}} \quad$ (L.B 2006)

## Solution:

$$
\begin{aligned}
& y=x^{x} \\
& \text { Taking ' } \ell n \text { ' on both sides } \\
& \ln y=\ell n x^{x} \\
& \ell \text { ny } \quad=x \ell n x \\
& \frac{1}{y} \cdot \frac{d y}{d x}=x \cdot \frac{1}{x}+\ell n x .1 \\
& \frac{d y}{d x}=y[1+\ell n x] \\
& \frac{d y}{d x}=x^{x}(1+\ell n x) \\
& \frac{d^{2} y}{d x^{2}}=x^{x} \frac{d}{d x}(1+\ell n x)+(1+\ell \ln x) \frac{d}{d x}\left(x^{x}\right)
\end{aligned}
$$

$$
\begin{aligned}
& \frac{d^{2} y}{d x^{2}}=x^{x} \cdot \frac{1}{x}+(1+\ell n x) \cdot x^{x}(1+\ell n x) \\
& \frac{d^{2} y}{d x^{2}}=x^{x}\left[\frac{1}{x}+(1+\ln x)^{2}\right]
\end{aligned}
$$

For stationary points
Put $\quad \frac{d y}{d x}=0$

$$
\begin{aligned}
\mathrm{x}^{\mathrm{x}}(1+\ell \mathrm{n} \mathrm{x}) & =0 \\
1+\ln \mathrm{x} & =0 \quad, \quad \mathrm{x}^{\mathrm{x}} \neq 0 \\
\ell \mathrm{ne}+\ell \mathrm{nx} & =0 \\
\ell \mathrm{n} \mathrm{x} & =-\ell \mathrm{ne} \\
\ell \mathrm{n} x & =\ell \mathrm{ne}^{-1} \\
\mathrm{x} & =\mathrm{e}^{-1} \\
\mathrm{x} & =\frac{1}{\mathrm{e}}
\end{aligned}
$$

Put

$$
\begin{aligned}
\mathrm{x} & =\frac{1}{\mathrm{e}} \text { in } \frac{\mathrm{d}^{2} \mathrm{~d}}{\mathrm{~d}^{2} \mathrm{x}}, \text { we get } \\
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}} & =\left(\frac{1}{\mathrm{e}}\right)^{\left.\frac{1}{\mathrm{e}}\left[\frac{1}{\frac{1}{e}}+\left(1-+\ln \frac{1}{\mathrm{e}}\right)^{2}\right]\right]} \\
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}} & =\left(\frac{1}{\mathrm{e}}\right)^{\frac{1}{\mathrm{e}}}\left[\mathrm{e}+\left(1+\ln \mathrm{e}^{-1}\right)^{2}\right] \\
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}} & =\left(\frac{1}{\mathrm{e}}\right)^{\frac{1}{\mathrm{e}}}\left[\mathrm{e}+(1-\ell \mathrm{ne})^{2}\right] \\
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}} & =\left(\frac{1}{\mathrm{e}}\right)^{\frac{1}{\mathrm{e}}}\left[\mathrm{e}+(1-1)^{2}\right] \\
\frac{\mathrm{d}^{2} \mathrm{y}}{\mathrm{dx}^{2}} & =\mathrm{e}\left(\frac{1}{\mathrm{e}}\right)^{\frac{1}{\mathrm{e}}>0}>0
\end{aligned}
$$

Shows $\mathrm{y}=\mathrm{x}^{\mathrm{x}}$ has a minimum value at $\mathrm{x}=\frac{1}{\mathrm{e}}$
