# **Exercise 2.8**

## Question #1

Operation  $\oplus$  performed on the two-member set  $G = \{0,1\}$  is shown in the adjoining table. Answers the questions:

- (i) Name the identity element if it exists?
- (ii) What is the inverse of 1?
- (iii) Is the set G, under the given operation a group?

Abelian and non-abelian?

$\oplus$	0	1
0	1	1
1	1	0

### Solutions

i) From the given table we have

$$0+0=0$$
 and  $0+1=1$ 

This show that 0 is the identity element.

- ii) Since 1+1=0 (identity element) so the inverse of 1 is 1.
- iii) It is clear from table that element of the given set satisfy closure law, associative law, identity law and inverse law thus given set is group under  $\oplus$ .

Also it satisfies commutative law so it is an abelian group.

#### **Question #2**

The operation  $\oplus$  as performed on the set  $\{0,1,2,3\}$  is shown in the adjoining table, shown that the set is an Abelian group?

#### Solution

Suppose  $G = \{0,1,2,3\}$ 

- i) The given table show that each element of the table is a member of G thus closure law holds.
- ii)  $\oplus$  is associative in G.
- iii) Table show that 0 is identity element w.r.t.  $\oplus$ .
- iv) Since 0 + 0 = 0, 1 + 3 = 0, 2 + 2 = 0, 3 + 1 = 0

$\Rightarrow$	$0^{-1} = 0$	$1^{-1} = 3$	$2^{-1} =$	$2, 3^{-1} = 1$
_	-0	, I - J	, 4 -	2, 5 -1

$\oplus$	0	1	2	3
0	0	1	2	3
1	1	2	3	0
2	2	3	0	1
3	3	0	1	2

v) As the table is symmetric w.r.t. to the principal diagonal. Hence commutative law holds.

#### **Ouestion #3**

For each of the following sets, determine whether or not the set forms a group with respect to the indicated operation. From above table solve these (i-v) options.

## Solution

- (i) As  $0 \in \mathbb{Q}$ , multiplicative inverse of 0 in not in set  $\mathbb{Q}$ . Therefore the set of rational number is not a group w.r.t to "·".
- (ii) a-Closure property holds in  $\mathbb{Q}$  under + because sum of two rational number is also rational.
- b- Associative property holds in  $\mathbb{Q}$  under addition.
- c-  $0 \in \mathbb{Q}$  is an identity element.

#### FSc-I / 2.8 - 2

*d*- If  $a \in \mathbb{Q}$  then additive inverse  $-a \in \mathbb{Q}$  such that a + (-a) = (-a) + a = 0. Therefore the set of rational number is group under addition.

- (iii) *a* Since for  $a,b \in \mathbb{Q}^+$ ,  $ab \in \mathbb{Q}^+$  thus closure law holds.
- b- For  $a,b,c \in \mathbb{Q}$ , a(bc) = (ab)c thus associative law holds.
- c- Since  $1 \in \mathbb{Q}^+$  such that for  $a \in \mathbb{Q}^+$ ,  $a \times 1 = 1 \times a = a$ . Hence 1 is the identity element.

$$d\text{- For }a\in\mathbb{Q}^+\;,\quad \frac{1}{a}\in\mathbb{Q}^+\;\text{such that }a\times\frac{1}{a}=\frac{1}{a}\times a=1.\;\text{ Thus inverse of }a\;\text{is }\frac{1}{a}.$$

Hence  $\mathbb{Q}^+$  is group under addition.

- (iv) Since  $\mathbb{Z} = \{0, \pm 1, \pm 2, \pm 3, \dots \}$
- a- Since sum of integers is an integer therefore for  $a, b \in \mathbb{Z}$ ,  $a+b \in \mathbb{Z}$ .
- b-Since a+(b+c)=(a+b)+c thus associative law holds in  $\mathbb{Z}$ .
- c- Since  $0 \in \mathbb{Z}$  such that for  $a \in \mathbb{Z}$ ,  $a+0=0+a=\mathbb{Z}$ . Thus 0 an identity element.
- d- For  $a \in \mathbb{Z}$ ,  $-a \in \mathbb{Z}$  such that a + (-a) = (-a) + a = 0. Thus inverse of a is -a.
- (v) Since  $\mathbb{Z} = \{0, \pm 1, \pm 2, \pm 3, \dots \}$

For any  $a \in \mathbb{Z}$  the multiplicative inverse of a is  $\frac{1}{a} \notin \mathbb{Z}$ . Hence  $\mathbb{Z}$  is not a group under multiplication.

#### **Question #4**

Show that the adjoining table represents the sums of the elements of the set  $\{E,O\}$ . What is the identity element of this set? Show that this set is abelian group..

#### Solution

As 
$$E + E = E$$
,  $E + O = O$ ,  $O + O = E$ 

Thus the table represents the sums of the elements of set  $\{E,O\}$ .

The identity element of the set is E because

$$E + E = E + E = E$$
 &  $E + O = O + E = E$ .

i) From the table each element belong to the set  $\{E, O\}$ .

Hence closure law is satisfied.

- ii)  $\oplus$  is associative in  $\{E,O\}$
- iii) E is the identity element of w.r.t to  $\oplus$
- iv) As O + O = E and E + E = E, thus inverse of O is O and inverse of E is E.
- v) As the table is symmetric about the principle diagonal therefore  $\oplus$  is commutative.

Hence  $\{E,O\}$  is abelian group under  $\oplus$ .

## Question # 5

Show that the set  $\{1, \omega, \omega^2\}$ , when  $\omega^3 = 1$  is an abelian group w.r.t. ordinary multiplication.

#### Solution

Suppose 
$$G = \{1, \omega, \omega^2\}$$

$\otimes$	1	ω	$\omega^2$
1	1	ω	$\omega^2$
ω	ω	$\omega^2$	1
$\omega^2$	an <sup>2</sup>	1	ci(W)

 $E \mid O$ 

- i) A table show that all the entries belong to G.
- ii) Associative law holds in G w.r.t. multiplication.

e.g. 
$$1 \times (\omega \times \omega^2) = 1 \times 1 = 1$$
  
 $(1 \times \omega) \times \omega^2 = \omega \times \omega^2 = 1$ 

iii) Since  $1 \times 1 = 1$ ,  $1 \times \omega = \omega \times 1 = \omega$ ,  $1 \times \omega^2 = \omega^2 \times 1 = \omega^2$ 

Thus 1 is an identity element in G.

iv) Since  $1 \times 1 = 1 \times 1 = 1$ ,  $\omega \times \omega^2 = \omega^2 \times \omega = 1$ ,  $\omega^2 \times \omega = \omega \times \omega^2 = 1$  therefore inverse of 1 is 1, inverse of  $\omega$  is  $\omega^2$ , inverse of  $\omega^2$  is  $\omega$ .

v) As table is symmetric about principle diagonal therefore commutative law holds in *G*.

Hence G is an abelian group under multiplication.

## Question # 6

If G is a group under the operation \* and  $a,b \in G$ , find the solutions of the equations: a\*x=b, x\*a=b

Solution

Given that G is a group under the operation \* and  $a,b \in G$  such that

$$a * x = b$$

As  $a \in G$  and G is group so  $a^{-1} \in G$  such that

$$a^{-1} * (a * x) = a^{-1} * b$$
  
 $\Rightarrow (a^{-1} * a) * x = a^{-1} * b$  as associative law hold in  $G$ .  
 $\Rightarrow e * x = a^{-1} * b$  by inverse law.  
 $\Rightarrow x = a^{-1} * b$  by identity law.

And for

$$x*a=b$$

$$\Rightarrow (x*a)*a^{-1}=b*a^{-1}$$
 For  $a \in G$ ,  $a^{-1} \in G$ 

$$\Rightarrow x*(a*a^{-1})=b*a^{-1}$$
 as associative law hold in  $G$ .
$$\Rightarrow x*e=b*a^{-1}$$
 by inverse law.
$$\Rightarrow x=b*a^{-1}$$
 by identity law.

## Question # 7

Show that the set consisting of elements of the form  $a + \sqrt{3}b$  (a,b being rational), is an abelian group w.r.t. addition.

Solution

Consider 
$$G = \{a + \sqrt{3}b \mid a, b \in \mathbb{Q}\}$$

i) Let  $a + \sqrt{3}b$ ,  $c + \sqrt{3}d \in G$ , where a, b, c & d are rational.

$$(a+\sqrt{3}b)+(c+\sqrt{3}d)=(a+c)+\sqrt{3}(b+d)=a'+\sqrt{3}b'\in G$$

where a' = a + c and b' = b + d are rational as sum of rational is rational.

Thus closure law holds in G under addition.

ii) For  $a + \sqrt{3}b$ ,  $c + \sqrt{3}d$ ,  $e + \sqrt{3}f \in G$ 

## AllResult.pk

$$(a+\sqrt{3}b)+\left((c+\sqrt{3}d)+(e+\sqrt{3}f)\right) = (a+\sqrt{3}b)+\left((c+e)+\sqrt{3}(d+f)\right)$$

$$= (a+(c+e))+\sqrt{3}\left(b+(d+f)\right)$$

$$= (a+c)+e)+\sqrt{3}\left((b+d)+f\right)$$
As associative law hold in  $\mathbb{Q}$ 

$$= \left((a+c)+\sqrt{3}(b+d)\right)+(e+\sqrt{3}f)$$

$$= \left((a+\sqrt{3}b)+(c+\sqrt{3}d)\right)+(e+\sqrt{3}f)$$

Thus associative law hold in G under addition.

iii) 
$$0 + \sqrt{3} \cdot 0 \in G$$
 as 0 is a rational such that for any  $a + \sqrt{3}b \in G$   
 $(a + \sqrt{3}b) + (0 + \sqrt{3} \cdot 0) = (a + 0) + \sqrt{3}(b + 0) = a + \sqrt{3}b$   
And  $(0 + \sqrt{3} \cdot 0) + (a + \sqrt{3}b) = (0 + a) + \sqrt{3}(0 + b) = a + \sqrt{3}b$ 

Thus  $0 + \sqrt{3} \cdot 0$  is an identity element in G.

iv) For  $a + \sqrt{3}b \in G$  where a & b are rational there exit rational -a & -b such that

$$(a+\sqrt{3}b)+((-a)+\sqrt{3}(-b))=(a+(-a))+\sqrt{3}(b+(-b))=0+\sqrt{3}\cdot 0$$

& 
$$((-a) + \sqrt{3}(-b)) + (a + \sqrt{3}b) = ((-a) + a) + \sqrt{3}((-b) + b) = 0 + \sqrt{3} \cdot 0$$

Thus inverse of  $a + \sqrt{3}b$  is  $(-a) + \sqrt{3}(-b)$  exists in G.

v) For 
$$a + \sqrt{3}b$$
,  $c + \sqrt{3}d \in G$   

$$(a + \sqrt{3}b) + (c + \sqrt{3}d) = (a + c) + \sqrt{3}(b + d)$$

$$= (c + a) + \sqrt{3}(d + b)$$
 As commutative law hold in  $\mathbb{Q}$ .  

$$= (c + d\sqrt{3}) + (a + \sqrt{3}b)$$

Thus Commutative law holds in G under addition.

And hence *G* is an abelian group under addition.

#### **Question 8**

Determine whether (P(S),\*), where \* stands for intersection is a semi group, a monoid or neither. If it is a monoid, specify its identity.

Solution

Let  $A, B \in P(S)$  where A & B are subsets of S.

As intersection of two subsets of S is subset of S.

Therefore  $A * B = A \cap B \in P(S)$ . Thus closure law holds in P(S).

For  $A, B, C \in P(S)$ 

$$A*(B*C) = A \cap (B \cap C) = (A \cap B) \cap C = (A*B)*C$$

Thus associative law holds and P(S).

And hence (P(S),\*) is a semi-group.

For  $A \in P(S)$  where A is a subset of S we have  $S \in P(S)$  such that

$$A \cap S = S \cap A = A$$
.

Thus S is an identity element in P(S). And hence (P(S),\*) is a monoid.

## **Question 9**

Complete the following table to obtain a semi-group under \*

Let  $x_1$  and  $x_2$  be the required elements.

By associative law

$$(a*a)*a = a*(a*a)$$

$$\Rightarrow c*a = a*c$$

$$\Rightarrow x_1 = b$$

Now again by associative law (a\*a)\*b = a\*(a\*b)

$$\Rightarrow c*b=a*a \Rightarrow x_2=c$$

*	а	b	c
а	С	а	b
b	a	b	С
С	$x_1$	$x_2$	а

## **Question 10**

Prove that all  $2\times 2$  non-singular matrices over the real field form a non-abelian group under multiplication.

Solution Let G be the all non-singular  $2\times 2$  matrices over the real field.

Let  $A, B \in G$  then  $A_{2\times 2} \times B_{2\times 2} = C_{2\times 2} \in G$ i)

Thus closure law holds in G under multiplication.

ii) Associative law in matrices of same order under multiplication holds. therefore for  $A, B, C \in G$ 

$$A \times (B \times C) = (A \times B) \times C$$

 $I_{2\times 2} = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$  is a non-singular matrix such that  $A_{2\times 2} \times I_{2\times 2} = I_{2\times 2} \times A_{2\times 2} = A_{2\times 2}$  as I is an identity element in G

$$A_{2\times2} \times I_{2\times2} = I_{2\times2} \times A_{2\times2} = A_{2\times2}$$

Thus  $I_{2\times 2}$  is an identity element in G.

- Since inverse of non-singular square matrix exists, therefore for  $A \in G$  there exist  $A^{-1} \in G$  such that  $AA^{-1} = A^{-1}A = I$ .
- As we know for any two matrices  $A, B \in G$ ,  $AB \neq BA$  in general.

Therefore commutative law does not holds in G under multiplication.

Hence the set of all  $2\times 2$  non-singular matrices over a real field is a non-abelian group under multiplication.
